USER WORKFLOW (FLASK PROJECT)

1. **User Request**
    - User sends a request from frontend (web form, mobile app, or API client).
2. **Flask Routing**
    - The request hits a Flask route (@app.route) defined in your project.
    - URL + method (GET/POST) decide which function is triggered.
3. **Request Handling & Validation**
    - Input data is validated (forms, JSON, query params).
    - Decision point: *Is input valid?*
        - Yes → continue.
        - No → return error response.
4. **Business Logic (Controllers/Services)**
    - Core logic runs (authentication, processing, calculations, ML model, etc.).
5. **Database Interaction**
    - ORM (like SQLAlchemy) or direct queries fetch/update records.
    - Decision point: *Does record exist?* → Yes → update/fetch; No → handle error.
6. **Template Rendering / API Response**
    - If it's a web app → Jinja2 templates render HTML.
    - If it's an API → JSON response is built.
7. **Response to User**
    - User sees results on frontend (success, error, dashboard, etc.).
8. **Logging & Monitoring**
    - Flask logs request/response.
    - Errors captured for debugging and monitoring.
